Introductory Python for Data Science

Introductory Python for Data Science

Module 0

Course overview

Logistics

- Emergency exits
- Amenities
- Breaks
- Questions

Agenda

- Introductions
- Learning outcomes
- Course contents
- Questions

Introductions

- Please share:
 - Name
 - Current/ last role and background
 - Your objectives and expectations of attending the course

Learning outcomes

- Provides the basic programming skills necessary to complete the [Data Science & AI program pre-work](#)
- Basic skills in programming in Python for data science including:
 - Use [Google Colab](#) - Jupyter Notebook to write and run Python code
 - Find and read the [Python documentation](#) for libraries and function.
 - Work with basic [Python data types](#) (string, float, integer, list, etc)
 - Write [Python expressions](#) that involve variables, variable assignment, operators and functions
 - Use [Python conditional and loop](#) functions
 - Resolve coding errors
 - Create basic graphs
 - [Read, clean and manage data](#)

Course contents

- Overview
- Programming as a problem-solving technique
 - Lab 1
- Python environments, tools and key libraries
 - Lab 2
- Data analysis in Python and data analysis projects
 - Lab 3
- Summary and call for action

Questions

Introductory Python for Data Science

Module 1

Programming as problem-solving

Agenda

- What is programming?
- Importance of programming for data science
- Python Fundamentals
- Developing and running Python
- Input and output functions options
- Data structures in Python
- Writing functions in Python
- Iterating in Python

What is programming?

- Programming is:
 - the process of creating a set of **instructions** that tell a computer how to perform a **task**.
 - thinking **systematically** and **critically**
 - breaking a task into steps. Examples include: a **recipe**, **directions** to a destination and **mathematical** problem solving.
- A program usually takes an **input** and produce an **output**.
- You can think of programming as a way to **solve a problem** to generate the **required output** from a **given input**.
- Difference between **programming** and **coding**?
 - Programming is the skill to specify a program **independent** of any programming language.
 - Coding is writing the program in a specific **programming language**.

Programming is a fundamental skill for data science

- Data science involves **problem solving** at many levels and in each step of a project in an implicit (conceptual) or explicit form (programs).
- **Programming**, which is the main tool for data science, can be defined in its essential form as a problem-solving technique for data-driven problems.
- **Python** is the most popular programming language for data science

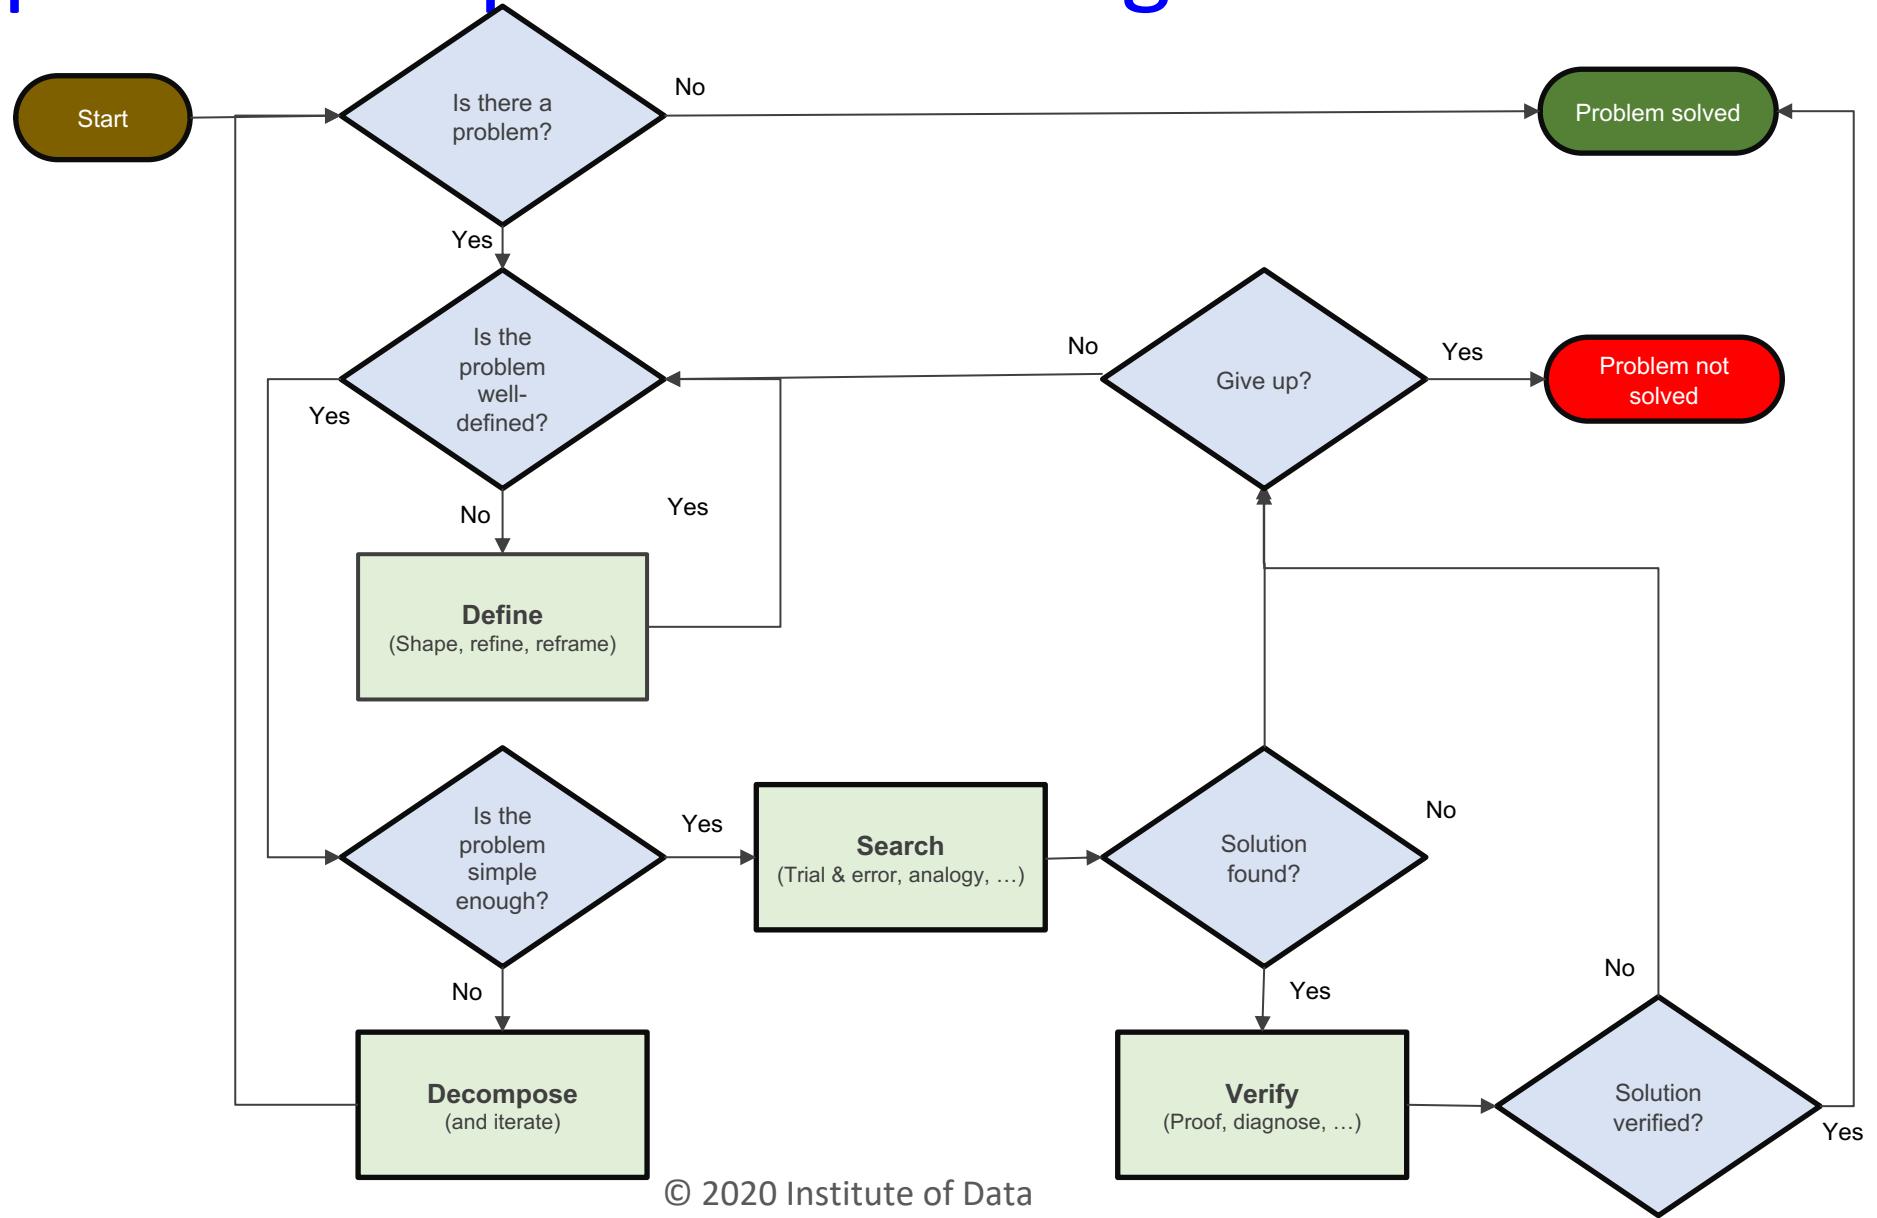

Problem solving

- Problem solving is the **process** of finding solutions to difficult or complex issues.
- Scientific method involves stating problems in a manner that facilitate solving them *mathematically* and verify them *empirically*.
- Problems can be solved techniques include a combination of the following actions:
 - Define
 - Decompose
 - Search
 - Validate

An approach for problem solving

Python programming language

- Python is a [high-level programming language](#), and its core design philosophy is all about code [readability](#) and a syntax which allows programmers to express concepts in a few lines of code.
- Python is used for developing many different types of computer programs including:
 - [Data Analysis](#)
 - [Data visualisation](#)
 - [Machine Learning](#)

Python comments

- Single line comment

```
# This is a comment
```

- Multiple line comments

```
"""
```

```
Multiple line comment
```

```
"""
```

Python input and output functions

- Input function receives an input from the user

```
Data = input('Please enter your name:')
```

- Print function prints formatted text and variables

```
A = 100
```

```
Print(f"This is a text and embedded variable {A}")
```

Python variables and data types

- **Variables** are used to store **information** to be referenced and manipulated in a computer program.
- Common data types
 - **Integer** <int> examples: 1, 1095, -2
 - **Float** <float> examples: 1.2, - 2974.074
 - **String** <str> examples: ‘Bob, “This is a longer string \t with special char’s”
 - **Boolean** <bool> examples: True, False
- Python allows you to **convert** variables between these types when needed
- **Type** command
 - `type(12.65) -> <class 'float'>`

Python operations

- Math operations
 - + plus - minus / divide * multiply
 - < less-than < greater-than <= less-than-equal
 - >= greater-than-equal
- Logic operations
 - and, or, not

If/else, for loops, while loops

- The **if/else** statement executes a block of code if a **specified condition** is true. If condition is not met, another block of code can be executed.
- **Loops** through a block of code a **number of times**
- **Loops** through a block of code while a specified **condition** is met
- continue
- break
- pass

```
var = 10
if (var >= 5):
    print('var mayor o igual que 5')
elif (var < 0):
    print('var es negativo')
elif (var == 0):
    print('var es cero')
else:
    print('var es menor que 5')
```

```
for i in range(10):
    print(i)
```

```
var = 10
while(var <= 20):
    print('var es menor o igual a 20')
    var+=2
```

Data structures

- **lists**
 - A list is the Python equivalent of an array, but is resizable and can contain elements of different types
 - Functions: append, extend, insert, remove, pop, clear, index, count, sort, reverse, copy
 - comprehensions
- **tuples**
 - A tuple is an (immutable) ordered list of values.
- **sets**
 - A set is an unordered collection with no duplicate elements.
- **dictionaries**
 - A dictionary stores (key, value) pairs

```
Tuple_x = (2, 7)
```

```
List_y = [2, 4, 6, 8]
```

```
Dictionary_z = {"id": 123,  
"name": "Item 123"}
```

Functions

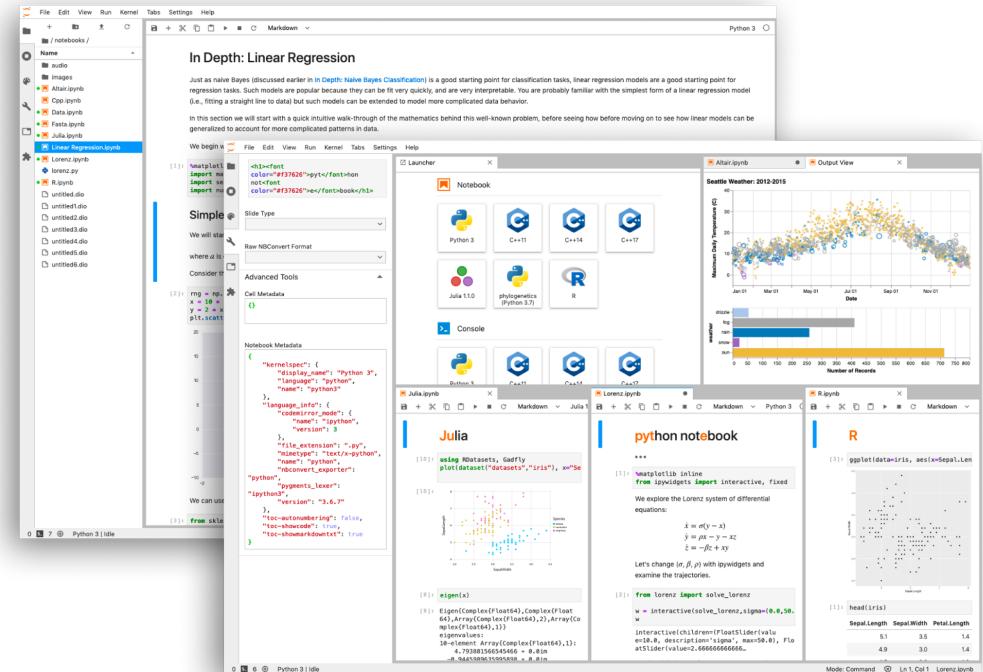

```
def funcName(param1, param2, defArg1 = 0, defArg2 = 100):  
    # code here  
    return someResult
```

- Optional parameters take default arguments if missing from function call
- Arguments are assigned to parameters in defined sequence unless named in call
- `return` statement
 - optional
 - can return multiple items
- `scope` is inherited from main (but not from a calling function)

Jupyter notebook and Google colab

- The Jupyter Notebook is an open-source web application that allows you to create and share documents that contain live code, equations, visualizations and narrative text.
- Google Colab** is a free cloud service that provides a Jupyter notebook environment for developing python data science projects.
 - We will use Google Colab for exercises in this course

Lab 1: First Python program

- You should receive an invite to a Jupyter Notebook on Google Colab
- Open the notebook, save it on you Google drive
- Read and follow the instructions in the notebook

Introductory Python for Data Science

Module 2

Python environment, tools and libraries

Agenda

- Python environment
- Python tools
- Python libraries

Environments

What is an environment?

A practical way to deal with Python's packages (libraries)

Issues:

- Many packages have not been around long enough to be tested with other packages that you might want to use with them
- packages don't always get updated quickly in response to updated dependencies

solution:

- Create virtual environments for hosting isolated projects using [Anaconda](#) Navigator

Installing Packages with pip

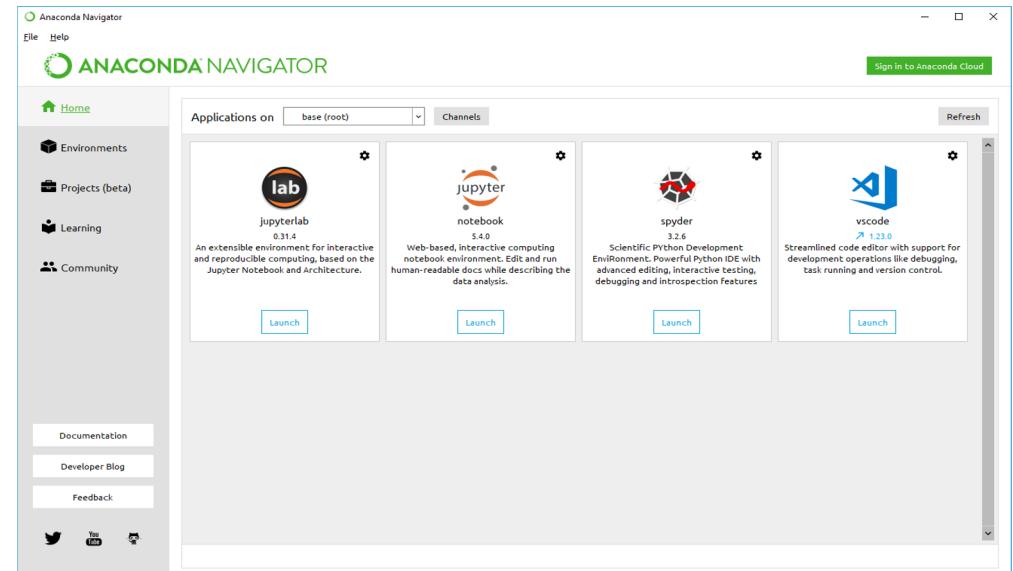

- install a package
- upgrade a package
- install a specific version
- install a set of requirements
- install from an alternate index
- install from a local archive

```
$ pip install anypkg  
$ pip install --upgrade anypkg  
$ pip install anypkg==1.0.4  
$ pip install -r reqsfile.txt  
$ pip install --index-url  
http://my.package.repo/simple/ anypkg  
$ pip install ./downloads/anypkg-  
1.0.1.tar.gz
```

Anaconda

Anaconda Distribution is **the recommended way** to configure and manage your Python development and running environment(s).

SciPy

- SciPy (pronounced “Sigh Pie”) is a Python-based ecosystem of open-source software for mathematics, science, and engineering. In particular.
- Main libraries (packages) include numpy, scipy, matplotlib, ipython, jupyter, pandas, sympy, nose

The screenshot shows the official SciPy website at <https://www.scipy.org/>. The header features the SciPy logo and the text "Sponsored By ENTHOUGHT". Below the header is a blue navigation bar with links for "Install", "Getting Started", "Documentation", "Report Bugs", and "Blogs". Underneath the navigation bar, there is a section titled "SciPy (pronounced ‘Sigh Pie’) is a Python-based ecosystem of open-source software for mathematics, science, and engineering. In particular, these are some of the core packages:". This section displays icons and descriptions for six core packages: NumPy, SciPy library, Matplotlib, IPython, Sympy, and pandas.

Package	Description
NumPy	Base N-dimensional array package
SciPy library	Fundamental library for scientific computing
Matplotlib	Comprehensive 2D Plotting
IPython	Enhanced Interactive Console
Sympy	Symbolic mathematics
pandas	Data structures & analysis

<https://www.scipy.org/>

Numpy

- Numpy is the fundamental package for scientific computing with Python
- A powerful N-dimensional array object
- Tools for integrating C/C++ and Fortran code
- Useful linear algebra, Fourier transform, and random number capabilities and many, many more

Numpy data types

Type	Python	Numpy	Usage
byte byte array	b'any string' bytearray()		<ul style="list-style-type: none">• immutable• mutable
integer	int()	<ul style="list-style-type: none">• 11 types	<ul style="list-style-type: none">• signed, unsigned• 8, 16, 32, 64 bits, unlimited
floating-point	float()	<ul style="list-style-type: none">• 3 types	<ul style="list-style-type: none">• 16, 32, 64 bits
complex	complex()	<ul style="list-style-type: none">• 2 types	<ul style="list-style-type: none">• 64, 128 bits
unassigned	None		<ul style="list-style-type: none">• object• myVar is not None
missing	nan	isnull(), notnull(), isnan()	<ul style="list-style-type: none">• float, object

Visualisation libraries

matplotlib

- histograms
- bars
- curves
- surfaces
- contours
- maps
- legends
- annotations
- primitives

Seaborn

- based on matplotlib
- prettier
- more informative
- more specialised

Lab 2: Python libraries

- You should receive an invite to a Jupyter Notebook on Google Colab
- Open the notebook, save it on you Google drive
- Read and follow the instructions in the notebook

Questions

Introductory Python for Data Science

Module 3

Data analysis in Python

Agenda

- Introduction to **data analysis**
- Data sources and shapes
- Data analysis operations
- **Pandas library**
- Data **loading**
- Data **visualisation**
- Data **statistics**
- Data **insights**

Data sources and shapes

- Where does data come from?
 - Databases
 - Transaction systems
 - Websites
- What data looks like?
 - Database tables
 - Spreadsheets
 - Structured or semi-structured files

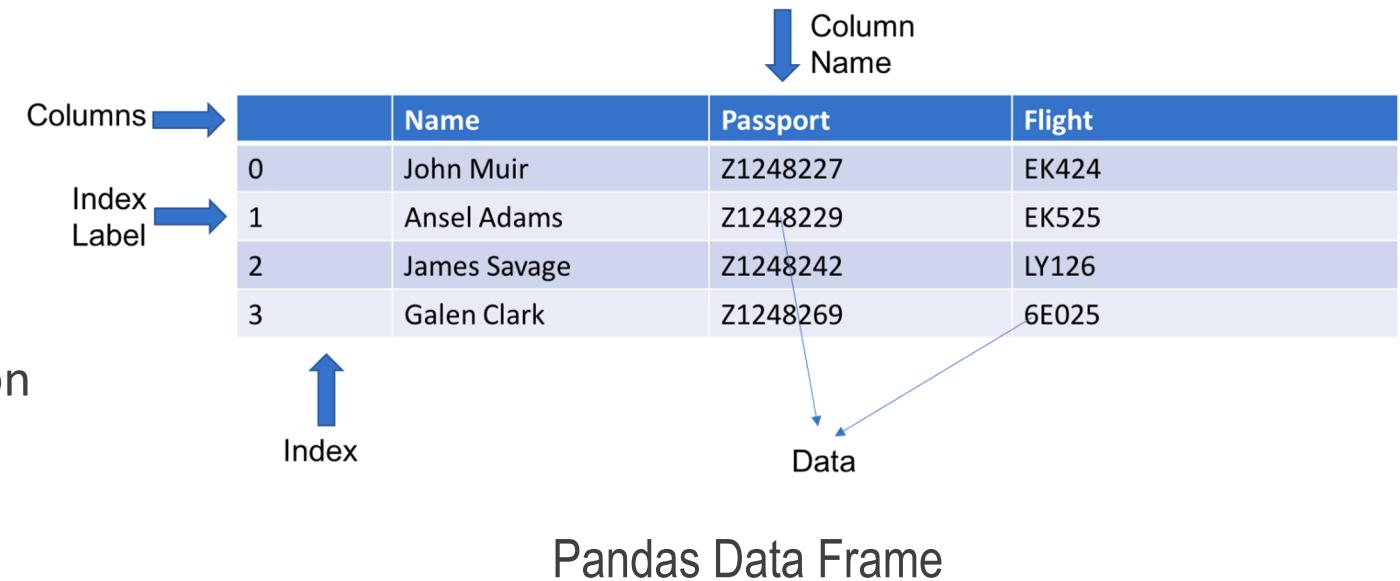

Data analysis operations

- Wrangling
 - Sourcing, loading, and precleaning the data so we can see what it really looks like
- Profiling
 - Visualising and understanding the essential characteristics of the data
- Munging
 - reshaping the data to prepare it for analysis

Pandas library

- Rich relational data analysis tool built on top of NumPy
- Easy to use and highly performing APIs
- A foundation for data wrangling, munging, preparation, etc in Python

Loading and exploring data

- Pandas can load data from many sources including csv files, websites and databases
- Pandas load data into a data structure called Data Frame which looks like a spreadsheet

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
weather =
pd.read_csv('https://coded2.herokuapp.com/d
atavizpandas/london2018.csv')
print(weather.head())
```

	Year	Month	Tmax	Tmin	Rain	Sun
0	2018	1	9.7	3.8	58.0	46.5
1	2018	2	6.7	0.6	29.0	92.0
2	2018	3	9.8	3.0	81.2	70.3
3	2018	4	15.5	7.9	65.2	113.4
4	2018	5	20.8	9.8	58.4	248.3

Data visualisation

- Data can be plotted directly from pandas' data frames using matplotlib
- There are many plot types available including:
 - Line chart
 - Bar chart
 - Scatter plot
 - Pie chart
 - Histograms
 - etc

```
weather.plot(y=[ 'Tmax' , 'Tmin' ] , x='Month')
```

Data statistics

- Pandas provides many functions that allow you to explore statistics of the data including:
 - Count
 - Mean
 - Standard deviation
 - Minimum
 - Maximum

```
dataset=load_iris()
data=pd.DataFrame(dataset[ "data"],columns=[ "Petal length","Petal Width","Sepal Length","Sepal Width"])
data[ "Species"] =dataset[ "target"]
data[ "Species"] =data[ "Species"].apply(lambda x:
dataset[ "target_names"][x])
print(data.head())
print(data.describe())
```

	Petal length	Petal Width	Sepal Length	Sepal Width	Species
0	5.1	3.5	1.4	0.2	setosa
1	4.9	3.0	1.4	0.2	setosa
2	4.7	3.2	1.3	0.2	setosa
3	4.6	3.1	1.5	0.2	setosa
4	5.0	3.6	1.4	0.2	setosa

	Petal length	Petal Width	Sepal Length	Sepal Width
count	150.000000	150.000000	150.000000	150.000000
mean	5.843333	3.057333	3.758000	1.199333
std	0.828066	0.435866	1.765298	0.762238
min	4.300000	2.000000	1.000000	0.100000
25%	5.100000	2.800000	1.600000	0.300000
50%	5.800000	3.000000	4.350000	1.300000
75%	6.400000	3.300000	5.100000	1.800000
max	7.900000	4.400000	6.900000	2.500000

Analytical insights

- Using pandas, numpy and matplotlib you can not just describe and visualise the data. You can obtain insights that show deeper relationships between various data elements.

```
sns.pairplot(data, hue="Species")
```

Questions

Introductory Python for Data Science

Module 4

Summary and call for action

Summary and call for action

- We explored what is **programming** and how it can be viewed as a **problem-solving technique**.
- We introduced **Python** as a suitable programming language for implementing data science projects
- We applied programming and data analysis techniques in a number of lab **exercises** that hopefully gave you a flavour of how data analysts, scientists and engineers use Python to perform **data-driven** projects.
- If today's information and hands-on practices **appealed** to you, **continue your learning** and enrol on the data science course.

Questions

Appendices

Data science and AI program pre-work

- The following [DataCamp Courses](#) are recommended and completion of them is required for entry into the program:
 - [Intro to Python for Data Science](#)
 - [Intermediate Python for Data Science](#)
 - [Statistical Thinking in Python \(Part 1\)](#)
 - [Statistical Thinking in Python \(Part 2\)](#)
 - [Importing Data in Python \(Part 1\)](#)
 - [Importing Data in Python \(Part 2\)](#)
 - [Python Data Science Toolbox \(Part 1\)](#)
 - [Python Data Science Toolbox \(Part 2\)](#)
 - [Intro to SQL](#)

End of presentation
